

Pg-Memo Search Engine

Pg-Memo is a PostgreSQL-based memory search engine for AI agents.

It supports full-text search using PostgreSQL tsvector, vector similarity search using pgvector with HNSW indexes, and hybrid search combining both methods for optimal relevance.

The system can index multiple file formats including Markdown, PDF documents, Word documents, and Excel spreadsheets. It watches the workspace directory for changes and automatically synchronizes the search index.

Key features:

- Real-time file watching with chokidar
- Embedding providers: OpenAI, Google, Zhipu, Aliyun
- Concurrent batch processing with retry
- MMR re-ranking for result diversity
- Temporal decay for freshness scoring
